

The Week That Was: 2012-1-07 (January 7, 2012)

Brought to You by SEPP (www.SEPP.org)

The Science and Environmental Policy Project

#####

SEPP / VA-SEEE Forum: January 23, 7 pm Mathews County, VA, Cornerstone Fellowship Church, 2243 Buckley Hall Road, Cobbs Creek, Va. Speakers include SEPP President Fred Singer, Dr. Charles Battig, and SEPP Exec. VP Ken Haapala. Topics include: status of global warming science and the divergence between models and observations. Why global models, even if modified for regional conditions, are unsuitable for local and regional planning. Agenda 21 and how to contest UN and Federal control over local land use issues.

#####

Joyous News: Fred Singer will be traveling to the Southwest and West US to spread the joyous news that the NIPCC Reports are correct and the IPCC models do not conform to observations. Humanity has little to fear from the false claims of unprecedented and dangerous global warming. Although his schedule is not final, his stops include: Houston-Austin from Feb 6 to 8; Southern California from Feb 8 to 12, with a talk at Chapman University on Feb 9, additional meeting in San Diego from on February 13 & 14 and the key Sigma Xi lecture at the University of New Mexico on Feb 16.

#####

Quote of the Week:

"The care of human life and happiness, and not their destruction, is the first and only legitimate object of good government." --Thomas Jefferson, letter to The Republican Citizens of Washington County, Maryland, 1809 [Concept dating to Aristotle.]

#####

Number of the Week: \$500 Million in any year

#####

THIS WEEK:

By Ken Haapala, Executive Vice President, Science and Environmental Policy Project (SEPP)

EPA Skinning the Cat: After cap-and-trade failed to pass the Senate controlled by his own party, President Obama famously stated there is more than one way to skin the cat. The cat, of course, is the American public and its use of energy. The preferred skinner is the EPA, which has launched a series of intensified regulations to drive up the cost of energy use to the public, emphasizing the consumption of electricity from coal fired utility plants. As described in prior TWTWs (e.g. July 9, Aug 6), the EPA rule for cross-state emissions was one such example of skinning the cat that depended on double and triple counting of its benefits. The benefits largely came from reductions of emissions from soot, which are controlled by a totally separate set of regulations. The other set of supposed benefits are a reduction of "acidic gases", namely sulfur dioxide and nitrous oxides. The claim is that reducing these gases will reduce new cases of childhood asthma, yet the statistical relationship between these gases and asthma is the opposite of what EPA claims. These cross-state regulations are now tied up in court.

The latest EPA effort to skin the cat are the new Mercury and Air Toxics rules (Utility MACT) announced just before Christmas. These include the double and triple accounting as the prior rules but also include the supposed benefits of reduction in mercury. And herein is the tale of two islands.

As published in the Wall Street Journal, and elsewhere, Willie Soon analyzed the proposed mercury rules. Below is a brief summary of one point in the Soon study. Mercury is a naturally occurring metal, found in the earth, seas, and the atmosphere. For many years mercury was used in thermometers, oral, indoor, and outside. It is used in fluorescent light bulbs. Certain compounds of mercury are toxic to humans, but humans evolved certain defenses against it.

A study of the mercury level in the blood of residents of the Faroe Islands, in the Norwegian Sea between Scotland and Iceland, indicated that the children may suffer from impaired cognitive functions from their mothers eating large amounts of seafood and having a certain level of mercury in their blood as a result.

A study of the mercury level of the residents of the Seychelles Islands off the east coast of Africa, the Seychelles Children Development Study, found no such impaired cognitive functions even though the residents eat large amounts of sea food. Similarly, no impaired cognitive functions have been found in populations of other nations consuming large amounts of sea food – except where toxins have been dumped into the local waters.

A scientific organization would have explored the difference between the eating habits of the residents of the Faroe Islands and the Seychelles Islands, and, perhaps, discovered that the residents of the Faroe Islands eat fish and whale meat and blubber where the residents of the Seychelles Islands eat fish but no whale meat and blubber. It turns out that whale meat and blubber are heavy in other toxins and have little selenium which binds to mercury and renders it largely non-toxic to humans.

The EPA did not perform a rigorous independent study of the science used in making its new rules. The EPA chose the Faroe Islands study to substantiate its pronouncements on acceptable mercury levels and ignored the Seychelles Islands study. Of course, Americans eat virtually no whale meat and blubber. Please see links under “EPA and other Regulators on the March.” The complete Soon report can be found at: http://scienceandpublicpolicy.org/images/stories/papers/reprint/scientific_reply.pdf

Number of the Week: \$500 Million in any year. In the report on the Endangerment Rule (ER) that greenhouse gas emissions endanger human health and welfare, the Office of Inspector General (OIG) of the EPA stated that a highly influential scientific assessment is one that could have a potential impact of more than \$500 million in any year. The OIG found the EPA failed to meet the necessary scientific review required under the Data Quality Act for its Endangerment Rule. Estimates for the costs of the new Utility MACT rules range from \$10 Billion up to \$100 Billion. Yet, the EPA failed to perform a rigorous review of the science used to justify the rules.

http://epw.senate.gov/public/index.cfm?FuseAction=Files.View&FileStore_id=e0584e33-d3da-4fba-b95a-e93

Quote of the Week: Based on the view of Thomas Jefferson, it appears the EPA has lost its legitimate object.

Litigation Issues: The oral arguments for the SEPP / CEI et al, lawsuit against the EPA for its finding that carbon dioxide emissions endanger human health and welfare are scheduled for February 28 and 29 (the leap year date when things are turned around). The earliest decision will probably be mid-summer. No doubt, the losing parties will appeal to the Supreme Court.

Sea Ice: In his classic, *Climate, History, and the Modern World*, HH Lamb suggested that Arctic sea ice may undergo cyclical changes for reasons not understood. For the past several summers alarmists warn that the disappearing sea ice is proof of global warming, implying the cause is carbon dioxide (CO₂) emissions. According to the Danish Meteorological Institute, Centre for Ocean and Ice (DMI), since 1978 the trend has been a reduction in September sea ice extent with the lowest year being 2007. For the last half of 2011 the sea ice extent remained generally above of 2007.

According to the measurements taken by DMI since 1958, at or above 80 degrees north latitude, the summer temperatures have remained remarkably similar but recent winter temperatures have been warmer than in the past. The sea ice is not freezing as thick or extensively in the winter, leading to reductions in the extent in the summer. Further, satellite observations show that the extent of the multi-

year sea ice is declining and shifting in location. One may be prompted to state this is the result of classic greenhouse warming – an increase of the low temperatures in arid regions such as winters in the Arctic.

However, as with everything else concerning the earth’s climate, it appears not to be that simple. This week an article was published in *Nature* that discusses changes in the circulation of the fresh water entering the Arctic Ocean from rivers in Russia. These waters appear to be flowing more towards the Pacific (counter-clockwise) than usual. The suggested cause is changes in the intensity of the Arctic Oscillation – defined by the US National Snow and Ice Data Center as “opposing atmospheric pressure patterns in northern middle and high latitudes.

“The oscillation exhibits a "negative phase" with relatively high pressure over the polar region and low pressure at midlatitudes (about 45 degrees North), and a "positive phase" in which the pattern is reversed. In the positive phase, higher pressure at midlatitudes drives ocean storms farther north, and changes in the circulation pattern bring wetter weather to Alaska, Scotland and Scandinavia, as well as drier conditions to the western United States and the Mediterranean. In the positive phase, frigid winter air does not extend as far into the middle of North America as it would during the negative phase of the oscillation. This keeps much of the United States east of the Rocky Mountains warmer than normal, but leaves Greenland and Newfoundland colder than usual. Weather patterns in the negative phase are in general "opposite" to those of the positive phase, as illustrated below.

“Over most of the past century, the Arctic Oscillation alternated between its positive and negative phases. **Starting in the 1970s, however, the oscillation has tended to stay in the positive phase, causing lower than normal arctic air pressure and higher than normal temperatures in much of the United States and northern Eurasia.**” [Boldface added.] http://nsidc.org/arcticmet/patterns/arctic_oscillation.html

If this is not sufficiently complicated, one can add the study of “Solar activity and Svalbard temperatures” linked in the December 17 TWTW. <http://arxiv.org/abs/1112.3256>. The strongest relationship appears to be in the winter – when the sun is below the horizon.

These issues remain to be sorted out, but at this time one can safely say that there is much more to climate change than increasing CO2. Please see links under “Changing Sea Ice.”

The Cart Before the Horse: Much has been written about the failures of companies that received loan guarantees from the Department of Energy (DOE). But little has been written about how ineptly the loan guarantee program was conducted. The Federal Government largely ignored critical, basic research and funded industries that needed a technology that was not yet developed. For example, breakthroughs in battery storage are needed before electric and hybrid automobiles become viable alternatives to the gasoline engine. Autos (electric, hybrid, natural gas) received \$9.1 Billion in loan guarantees – however an effective battery is yet to be developed.

To become viable on the grid, solar and wind generation needs to be competitive and reliable. Mass electricity storage is critically needed. DOE gave \$30 Billion in loan guarantees to companies involved with solar manufacturing (PV panels), wind generation, solar generation (large scale plants). DOE \$20 Million for grid level battery storage and \$40 Million for energy storage (a project that went bankrupt) – 500 times as much to applications than to the basic research on the technology needed to make the applications viable.

A Henry Ford would be appalled by such an impractical waste. Without mandates or subsidies the nation can expect many other bankruptcies in the future. Please see links under “Energy Issues.”

SEPP Amplification and Correction: Last week we failed to attribute quote of the week regarding the electricity needed for electric cars largely comes from coal fired power plants [about 45%] to Thomas Sowell.

ARTICLES:

1. Fake! Fake! Fake! Fake!

By S. Fred Singer, American Thinker, Jan 2, 2012
http://www.americanthinker.com/2012/01/fake_fake_fake_fake.html

In discussing the recent release of some 5,000 Climategate e-mails, blogger Anthony Watts uses the clever headline "They are real -- and they're spectacular." He credits Jerry Seinfeld as the source. Following his example, I choose the headline "Fake! Fake! Fake! Fake!" -- also taken from

a *Seinfeld* episode -- in discussing the surface temperatures generally reported for the latter part of the 20th century; they form the science basis for prosperity-killing international climate policy.

Here I am using the word "fake" as an adjective, and not as a verb. I mean to say that the scientific conclusions derived from such temperatures are *not real*, but I don't imply that the values themselves have been purposefully altered or adjusted. We simply don't have any information to support such an accusation.

But I do claim that the commonly reported and accepted warming between 1978 and 2000 is based only on thermometers from land surface stations and is not supported by any other evidence that I could find. Specifically, ocean data (from 71% of the earth's surface) and global atmospheric data (as recorded by satellites and independent balloon-borne radiosondes) do not show such a warming at all. In addition, most proxy data, from non-thermometer sources such as tree rings, ocean sediments, ice cores, stalagmites, etc., show no warming during this same crucial period. (One has to be careful in this analysis since the year 1998 shows a major warming spike caused by a Super-El Niño. But by 1999 and 2000, temperatures had returned to pre-1998 values.)

Now, I am well aware of the fact that the recent release of the temperature data from the Berkeley Earth Surface Temperature (BEST) project does show a warming trend from 1978 to 2000. Many would jump to the conclusion that this represents confirmation of the existence of global warming -- or even of anthropogenic global warming (AGW). However, that would be an error in logic.

What the BEST result shows is that surface thermometers from the land area of the globe (about 29% of the earth's surface) show a warming trend. But this is not *global* warming. And BEST director Professor Rich Muller explicitly disclaims that his trend results indicate a human cause.

He also correctly points out that many of the weather stations used are badly distributed, mostly in the U.S. and western Europe, and possibly subject to local heating effects, such as urban heat islands. He cautions that a third of his monitoring stations show a cooling, not a warming. And that 70% of the U.S. stations are poorly situated and don't satisfy the requirements of the U.S. Weather Service. It is likely that stations elsewhere have similar problems.

While we can applaud the fact that the BEST results agree with other analyses of weather station data, we still need to explain why they don't agree with atmospheric trends that are close to zero, or with ocean data that show no appreciable warming.

As a first step, the BEST data are ideally suited for a number of internal checks. For example, one would like to see if the number of stations changed appreciably between 1970 and 2000, and if their "demographics" changed -- which might lead to the formation of artificial trends.

There are many other such tests that can be performed. They might help us discover why land surface data disagree with all other data; thereby, we may get a better handle on whether the planet is really warming. We note here that the BEST results do not show any warming trend in the 21st century -- even though carbon dioxide levels have been rising more rapidly than before.

Note again: Professor Muller and his colleagues do not claim that their results indicate a human source for warming -- unlike the IPCC, the U.N. Science Panel, which has claimed to be 90%-99% sure that the late-20th century warming is anthropogenic. But if there is no warming between 1978 and 2000, then IPCC's case collapses -- and so do all policies built on the IPCC conclusion.

But this whole matter has really moved beyond any academic discussion. Industrialized nations that signed the Kyoto Protocol (including the U.S., which did not ratify) have already wasted hundreds of

billions of dollars on policies based on the acceptance of the IPCC claim that greenhouse gases (mainly carbon dioxide from the burning of oil, gas, and coal) are responsible for a reported warming -- which may not even exist.

(By now it should be obvious that [1] the enshrined temperature limit of +2 degC [beyond which climate disasters are supposed to set in] is based on fiction and has no scientific basis. As an annual global average temperature, so climate models tell us, it would mean warmer winter nights in Siberia and Canada -- perhaps -35 degrees instead of -40 -- and little warming in the tropics. [2] It should also be obvious that even strenuous and economy-killing efforts at mitigation will have little effect on atmospheric levels of carbon dioxide, let alone on climate. If a demonstration is needed, just look at the lack of warming since 1998, in spite of rapidly rising levels of greenhouse gases.)

As is evident from the Climategate e-mails, a small group of scientists, mainly in the U.K. and U.S., have managed to freeze out contrary evidence from being published in the scientific literature or in IPCC reports. The self-described "Team" members brazenly discuss strategies and action plans to further "The Cause." Unfortunately, they have largely succeeded -- and continue to influence publications, thanks to some key journalists and editors. In consequence of this [evident conspiracy](#), it is hardly surprising that politicians, the media, and the general public are receiving entirely wrong information about supposedly catastrophic effects of a future warming.

The just-concluded Durban conference, the 17th in an annual series, demonstrates clearly that the whole discussion is no longer about science, but instead is all about money. 1) How to assure continuing government careers for nearly 200 delegations, with annual vacations paid by taxpayers. (2) How to transfer \$100 billion a year from industrialized nations to LDCs (or more precisely, to their kleptocratic rulers), using "climate justice" or "climate guilt" (depending on who is doing the talking). (3) How to gain a national advantage by setting differential emission limits of CO₂ -- supposedly to keep the planet from reaching a "dangerous" level of warming.

Durban did succeed in extending Kyoto till 2015 -- presumably to allow time to fashion a successor protocol to include all nations. But it is a hollow victory. Russia and Japan have already announced that they are not continuing -- and Canada is formally withdrawing from Kyoto. In the U.S., the White House has never submitted Kyoto to the Democrat-controlled Senate for ratification. Instead, as promised, Obama is using indirect ways to "skin the cat" and make "electricity prices skyrocket" -- relying on EPA regulations to destroy domestic coal as a boiler fuel.

Yet hope springs eternal in the hearts of true warmistas that China, by far the largest emitter of carbon dioxide, will join a future protocol in 2015. In Durban, China's chief climate negotiator Xie ZhenHua dropped all kinds of hints that China might be willing to join a second commitment period of emission targets -- provided certain conditions are met. Not surprisingly, a number of environmental activists have taken the bait and really believe that China is willing to sacrifice economic growth to satisfy the elusive goal of controlling global warming.

Within the United States, and also elsewhere, global warming scares have become a means of transferring taxpayer money to politically influential cronies. There is now so much "crony capitalism" that it would be difficult to reverse or even stop the ongoing subsidies, outright grants, tax breaks, and other transfers to privileged groups.

Time is becoming short. We're reaching a tipping point -- not of the earth's climate, but of the financial schemes that permanently divert funds from productive activities into wasteful ones, all in the name of "saving the climate." The results are evident: higher levels of spending, deficits, or taxes; higher prices for energy and electricity and therefore for all manufactured goods; less productive activity; less employment; and more misery.

It seems odd that all of this is essentially based on a fake -- the data that seem to show a (nonexistent) warming. It will be difficult to overturn this notion, but we must keep trying.

2. EPA Rules Causing Plant Closures

By Charles Battig, VA-SEEE, Letter, WSJ, Jan 5, 2012

http://online.wsj.com/article/SB10001424052970204720204577130940380931240.html?mod=WSJ_Opinion_MIDDLEThirdBucket

Economist Julian Simon had a term for it: "false bad news." Nicole Lederer's Dec. 29 letter "New Pollution Rules Will Benefit Business" blends false good news with false bad news to produce imagined business and health benefits.

The new EPA rules for air-quality standards are already having their (intended) effect on coal-fired power plants. These companies are announcing numerous plant closures and eliminating jobs. These losses are neglected by Ms. Lederer's rosy predictions of thousands of new construction jobs.

The statement that "coal-fired power plants produce about half of all mercury" is scientifically vacuous and misleading. Tell us please, half of what total mercury sources? Where is the missing comparison? "The Myth of Killer Mercury" by Willie Soon and Paul Driessen (op-ed, May 25, 2011) presents the relative mercury contributions from various sources—U.S. coal-fired plants, about 41-48 tons per year; forest fires, about 44 tons per year; Chinese power plants, 400 tons per year, while recurring geological events such as volcanoes and geysers emit 9,000-10,000 tons per year. With these missing pieces of information, the U.S. power plant contribution of mercury is closer to a 0.5% value than the "half of all mercury" claim by Ms. Lederer.

Would that Ms. Lederer and the Environmental Entrepreneurs expend an equal amount of environmental anguish over placing compact fluorescent lamp bulbs indoors in homes, schools and factories. These mercury-containing, stealth-pollution bulbs bring the mercury threat right into your living room and nursery. Computer-generated illusory health benefits while neglecting real-world mercury bombs at home is "real" bad news.

3. American Heads in the Shale About China

Huge Chinese gas investments are flying under the radar of the U.S. Congress.

By Alisa Newman Hood, WSJ, Jan 5, 2012

http://online.wsj.com/article/SB10001424052970203471004577140274055422942.html?mod=WSJ_Opinion_LEFTTopBucket

China's state-owned oil companies are snapping up large minority stakes in some of the biggest shale gas plays and supporting industries in the United States. On Tuesday, Sinopec announced a \$2.5 billion deal with Devon Energy to extend fracking to five new areas. Yet the U.S. Congress has been silent on the implications of these investments for the country's energy security.

As the Journal reported last month, Cnooc and Sinopec have entered the race to buy a 30% stake in FTS International, a U.S. shale gas services company. This bid follows Cnooc's January 2011 purchase of a one-third stake in Chesapeake Energy's shale developments in Wyoming and Colorado and, more notably, its October 2010 purchase of a similar stake in the massive Eagle Ford shale development in Texas, again from Chesapeake.

The development of shale gas resources is poised to transform the U.S. natural gas market. It has already helped drive prices and imports to decade-long lows and led to a surge in employment in the states where it is most plentiful: Texas, North Dakota and Pennsylvania.

So it's incredible that Congress has evinced virtually no interest in Chinese investment in U.S. shale. To anyone who followed the noisily unsuccessful 2005 takeover of Unocal by Cnooc, this is incomprehensible.

More importantly, every minute of silence from Congress represents a lost opportunity to exert pressure on Beijing for the benefit of American companies. A vigorous exploration by Congress of Chinese investment in U.S. shale could help pry open similar opportunities for U.S. investment in China.

Back in the summer of 2005, when Cnooc announced its bid for Unocal, such was the outcry that one might have suspected the Chinese were bidding for Los Alamos rather than a midsize U.S. oil company. The House Armed Services Committee hastily convened a hearing, at which the proposed Chinese investment was the source of intense, at times shrill, debate.

James Woolsey, CIA director in the Clinton administration, testified, "China is pursuing a national strategy of domination of the energy markets and strategic dominance of the western Pacific." The controversy generated no fewer than four separate bills in Congress, including an overwhelming 333-92 vote by the House to block any Bush administration approval of the takeover.

As a result of the uproar, Cnooc withdrew its bid, paving the way for U.S. oil giant Chevron to acquire Unocal. In 2007, Congress passed the Foreign Investment and National Security Act, which added "energy assets" to the purview of the Committee on Foreign Investment in the United States, the executive branch body under the Treasury Department responsible for reviewing and approving foreign investment in strategic U.S. assets.

Six years and one massive economic downturn later, Congress is nowhere to be found. There have been no debates, no resolutions and no angry rhetoric. Cnooc's 2010 acquisition of the Texas shale stake even sailed through its CFIUS review.

The silence is even stranger when one considers the assets at stake. Unocal was not much more than a bit player on the U.S. energy scene. At the time of the takeover bid, it contributed less than 1% of U.S. oil and gas production. Its major producing assets were located primarily outside the United States, mostly in Southeast Asia. The company was hardly a large employer, and Cnooc had even pledged to retain all U.S. employees to overcome any potential concerns.

By contrast, the implications of shale gas for U.S. energy security, employment and the environment are hard to overstate. Add China to the mix and the issue sits at the intersection of some of the most important economic and foreign policy issues of the day.

There are several plausible explanations for the difference. One is that the Chinese companies, presumably on the advice of clever lawyers, have structured the recent deals to fly under the radar by purchasing minority interests and standing behind U.S. companies such as Devon and Chesapeake, which continue to serve as operators and marketers of the shale projects. Although perhaps no one deal is large enough to raise a red flag, these smaller deals are starting to accumulate and Congress should be looking at these investments in the aggregate.

Another theory is that politicians are concerned that too much noise may disrupt efforts by U.S. oil companies to access China's own shale gas reserves, which surpass even those of the United States. The U.S.-China Shale Gas Initiative announced by President Obama in 2009 was intended to support those very efforts. Earlier this year, Sinopec announced a partnership with Royal Dutch Shell Plc and Exxon Mobil Corp. to perform joint surveys of certain Chinese shale gas reserves.

That is a good start, but China has yet to take the important step of publishing production-sharing terms between its national oil companies and foreign investors. Surely U.S. companies would be better served by a Congress willing to apply some heat to China to ensure true reciprocal access rather than keeping its head down in order not to offend.

The Unocal episode, with its protectionist and even racist undertones, was not one of Congress's finer moments. At the same time, however, it showed at least that Congress was paying attention to matters of critical energy and national security import. Now is not the time for U.S. politicians to bury their heads in the shale.

Ms. Newman Hood is an adjunct professor of oil and gas law at the Georgetown University Law Center. A related editorial appears today.

4. Renewable Fuel Standards Formula For Global Poverty

Editorial, IBD, Jan 4, 2012

<http://news.investors.com/Article/596771/201201041839/appointments-show-obama-more-king-than-president.htm>

Energy Policy: There was a reason Congress let ethanol subsidies expire. Legislation mandating using corn as fuel will keep prices high. They will also increase poverty worldwide. Anyone remember the "tortilla riots?"

The Renewable Fuel Standards Program (RFS) was originally passed as part of the Energy Security Act of 2005. The Energy Independence and Security Act of 2007 expanded the renewable fuel standard for gasoline and the RFS mandates that at least 37% of the 2011-12 corn crop be converted to ethanol and blended with the gasoline that powers our cars.

"Producing ethanol for use in motor fuels increases the demand for corn, which ultimately raises the prices that consumers pay for a wide variety of foods at the grocery store, ranging from corn-syrup sweeteners in soft drinks to meat, dairy and poultry products," says the Congressional Budget Office. The RFS program ensures this mandate and ethanol production continues with costs being passed on to consumers at the checkout line and gas pump.

The mandate to burn food in our cars places our corn supply at risk to supply disruptions caused by drought and bad weather. Coming off the third-largest corn harvest in U.S. history in 2010, the carryover (unsold corn still in elevators), constituted only a two-week supply, the lowest level since the Dust Bowl of the 1930s.

According to the most recent USDA estimates, carryover stocks into the 2012 crop year will be only 6.7% of annual use, a level seen only once since 1950.

The RFS mandate requires a massive quantity of corn to be converted to ethanol each year regardless of price or available supply. In other words, our cars are now at the top of the food chain and if there's not enough to go around, its fuel first and food second.

According to a report prepared by 10 international organizations, including the World Bank and five different arms of the U.N., including the Food and Agriculture Organization and the International Fund for Agricultural Development, hardly right-wingers, increased bio-fuel mandates by governments mean the price of coarse grains could increase as much as 13%, oilseeds by 7% and vegetable oil 35% on average each year between 2013 and 2017.

As the American Enterprise Institute points out in a recent report, World Bank researchers Maros Ivanic, Will Martin and Hassan Zaman estimate that the ethanol-induced price spike between June and December 2010 forced 44 million people below the extreme poverty line of \$1.25 per day and that price increases from 2005-08 forced 105 million people below the extreme poverty line.

When demand for bio-fuels caused the price of corn tortillas, a staple of the Mexican diet, to rise precipitously in late 2006 and early 2007, many in Mexico took to the streets in what became known as the "tortilla riots." The Mexican tortilla crisis came after a rise in the cost of corn, itself induced by growing ethanol consumption and booming demand in emerging countries.

They were the first in a series of disturbances that year to hit emerging countries from Haiti to Bangladesh as the cost of agricultural commodities, including wheat and rice, reached record highs as cropland was diverted to biofuel production.

We have created a market where even the slightest production disturbances could have devastating consequences for the world's poor and severe consequences for American consumers. The breadbasket of the world is even at risk of one day having to import corn.

The ethanol mandates should depart along with the ethanol subsidies that expired at the beginning of the year. It's time to stop putting food in our gas tanks.
