

The Week That Was: 2019-09-28 (September 28, 2019)

Brought to You by SEPP (www.SEPP.org)

The Science and Environmental Policy Project

Quote of the Week – *"Sometimes people hold a core belief that is very strong. When they are presented with evidence that works against that belief, the new evidence cannot be accepted. It would create a feeling that is extremely uncomfortable, called cognitive dissonance. And because it is so important to protect the core belief, they will rationalize, ignore and even deny anything that doesn't fit in with the core belief."*— Frantz Fanon, French West Indian psychiatrist, political philosopher, revolutionary, [H/t William Readdy]

Number of the Week: 30% fewer labor hours

THIS WEEK:

By Ken Haapala, President, Science and Environmental Policy Project (SEPP)

UN Children's Climate Circus: The conditions for most of the world's population are improving significantly. Although wars are ongoing, there is no major world war, killing millions. There are no major famines, other than those created by government policies. World grain reserves are full, and production is increasing greatly in tropical countries, which were once considered too hot, with too thin, too acidic soils to be major grain producers. There is still much to do, particularly in Africa, South America and Asia, but, based on the World Bank. the numbers of people living in extreme poverty are declining significantly, with major reductions in Asia. So based on mathematical computer models, the UN and many international organizations are declaring we are in a "climate crisis" – based on projections of the future that are not validated by physical evidence today.

This week, the UN hosted a circus, celebrating fears of carbon dioxide (CO₂)-caused climate change featuring children and the fears and horrors their parents and teachers have taught them. Fears of monsters lurking in the dark have been used for generations to control the behavior of children. For example, Inuit artists carved the monsters their parents claimed would await them, if they wandered too far from the camp and the safety of the fire. Particularly, in the winter the fears were real, but the monsters were not. Similarly, Grimm's Fairy Tales were a collection of folk tales told to children to have them behave.

Given that carbon-based fuels are vital for modern civilization, it is unfortunate that these tales are told to and taken seriously by children. That children believe them, is not a surprise. Children are very gullible to well told stories evoking fears. The tragedy is that the grown-ups believe the children who have been repeatedly told the tale of "climate crisis."

According to the University of Rochester Medical Center, over the past 25 years great progress has been made in understanding the development of the human brain as one matures. Functional MRIs measuring blood flow in the brain have demonstrated the changes in the way information is processed in the brain as one matures in adolescence, from teenage, to adult. The center of thinking slowly changes from the amygdala, center of instinctive reaction, emotion, to the prefrontal cortex, the center for reasoned judgement with full change about the age of 25. Many

parents have been frustrated when they asked their teenager why the teenager did something stupid and heard the reply “it seemed like a good idea at the time”. This is common and has little to do with one’s intelligence. It has to do with mental maturity. The size of the prefrontal cortex is the major distinction between the human brain and that of other primates. It is sad to witness “climate crisis” advocates manipulating children, who naturally respond to fear and cannot yet resist reasonably, for their purposes.

As tragic as some of the child pronouncements were, it is disappointing to realize that the UN and the “climate crisis” promoters must stoop so low to mobilize support for their weakly supported ideas. On this subject, the popular press has lost all reasoned judgement. According to reports, the poster child of the movement and 15 others filed a formal complaint to the UN that Brazil, Germany, France and others had violated the Convention on the Rights of the Child by failing to take sufficiently bold measures to reduce carbon emissions. Germany and France have been among the most ardent promoters of the “climate crisis.” The formal complaint angered representatives of these governments. Did the handlers of the children go too far?

In reviewing some of the documents on the Convention, TWTW found no reference to the right to a stable climate. But this is just another example of the farce the UN’s insistence on a “climate crisis” has become. See links under Communicating Better to the Public – Use Propaganda on Children and Communicating Better to the Public – Use Children for Propaganda

A Fluid Issue: On his web site, No Tricks Zone, P. Gosselin has drawn attention to a short book by Japanese climate modeler Mototaka Nakamura, author of about 20 published papers on fluid dynamics. A new short book is written in both English and Japanese is available in Kindle. Australian reporter Tony Thomas, who has followed the climate issue for years, reviews the book, emphasizing that the certainty claimed by the UN Intergovernmental Panel on Climate Change (IPCC) and its followers is hollow.

Among other important changing phenomena, the climate system is largely made up of two fluids in dynamic motion, the oceans and the atmosphere, and we simply do not know enough about fluid dynamics to make long-term predictions about the interactions of these fluids. According to Nakamura the climate models are useful tools for academic purposes, but useless for prediction. As quoted by Thomas, Nakamura writes:

“These models completely lack some critically important climate processes and feedbacks and represent some other critically important climate processes and feedbacks in grossly distorted manners to the extent that makes these models totally useless for any meaningful climate prediction.

“I myself used to use climate simulation models for scientific studies, not for predictions, and learned about their problems and limitations in the process.”

Nakamura and his colleagues tried to repair the errors:

“...so, I know the workings of these models very well ... For better or worse I have more or less lost interest in the climate science and am not thrilled to spend so much of my time and energy in this kind of writing beyond the point that satisfies my own sense of obligation to the US and Japanese taxpayers who financially supported my higher education and spontaneous and free research activity. So please expect this to be the only writing of this sort coming from me.

“I am confident that some honest and courageous, true climate scientists will continue to publicly point out the fraudulent claims made by the mainstream climate science community in English. I regret to say this, but I am also confident that docile and/or incompetent Japanese climate researchers will remain silent until the ‘mainstream climate science community’ changes its tone, if ever.”

Thomas writes some of the gross model simplifications are:

- *# Ignorance about large and small-scale ocean dynamics.*
- *# A complete lack of meaningful representations of aerosol changes that generate clouds.*
- *# Lack of understanding of drivers of ice-albedo (reflectivity) feedbacks: “Without a reasonably accurate representation, it is impossible to make any meaningful predictions of climate variations and changes in the middle and high latitudes and thus the entire planet.”*
- *# Inability to deal with water vapor elements.*
- *# Arbitrary “tunings” (fudges) of key parameters that are not understood.*

As Richard Lindzen has stated for years, the models fail to capture changes in clouds including changing cloud area and that the sizes of clouds are too small for grid scale modeling.

Nakamura’s work reinforces what many, including Lindzen, have stated. But it is refreshing to see that a modeler who spent years trying to model the climate system recognizes how unsuccessful this 40 plus year effort has been. As will be discussed in future TWTWs there is a way to understand the influence of additional atmospheric carbon dioxide on the climate without resorting to modeling turbulent, dynamic fluids, which cannot produce reasonable results for prediction. See links under Challenging the Orthodoxy.

Number of the Week: 30% fewer labor hours: Promoters of the Green New Deal have been promising thousands of new green jobs. Apparently, members of the US United Auto Workers who went on strike are not impressed by the promise of electric automobiles. Sales of today’s electric autos require huge subsidies which, under current US laws, phase out after a production limit is reached. Unless there are dramatic technological breakthroughs,, which are yet to materialize, electric automobiles will be significantly more costly than vehicles with internal combustion engines, resulting in fewer sales and the weakening of the industry, resulting in fewer jobs. An additional issue is providing charging stations for electric vehicles. Who pays for them? Who powers them?

Further, according to the CEO of Volkswagen, electric cars have fewer moving parts, and production requires about 30% fewer labor-hours, resulting in fewer jobs. Globally the loss of these jobs will be partially offset by increases in mining and material processing jobs in lithium extracted in Argentina, Zimbabwe, Chile, China and Australia, and in cobalt extraction in the Democratic Republic of Congo. United Auto Workers will not be impressed if advocates of the Green New Deal include these jobs as promised green jobs. Further, what will generate the electricity to power these electric vehicles? See Article # 2.

Suppressing Scientific Inquiry

How to Evaluate the Evidence of Contrarians – Scientifically

By Jennifer Marohasy, Her Blog, Sep 21, 2019

<https://jennifermarohasy.com/2019/09/how-to-evaluate-the-evidence-of-contrarians-scientifically/>

“...Misha Ketchell who is the editor of the influential academic publication The Conversation is quoted claiming to care so much about the evidence that the opinions of ‘sceptics’ must be excluded.”

“But this begs the question: how do we define scepticism, and on what basis do we discount the opinion of a so-called sceptic?”

“If their opinions are at complete odds with the evidence: then wouldn’t it be more useful to show this? To use them, and their wrong claims, to explain the truth within the theory of human-caused global warming?”

“Science is a method, science is never settled. We must therefore always be open-minded, tolerant and ready to be proven wrong. But history will eventually show that it is Misha Ketchell who is wrong and that this editor is not using a reasonable, or in any way evidence-based, criteria for deciding what should be published. This is so very wrong and so very harmful to science, democracy and the capacity of other opinion leaders and academics to evaluate the evidence which is so necessary if they are to get to the truth in such matters as climate change.”

[SEPP Comment: Marohasy discusses how she has been suppressed by the climate establishment at the University of Queensland.]

ARTICLES

1. A Climate Change for Lawsuits

Will the Supreme Court leave it to juries to decide contested public issues?

By William McGurn, WSJ, Sep 23, 2019

https://www.wsj.com/articles/a-climate-change-for-lawsuits-11569279287?mod=hp_opin_pos_2

TWTW Summary: The journalist writes:

“When National Review founder William F. Buckley Jr. was alive, the American Civil Liberties Union was a frequent target of his barbs. Once he even devoted an episode of “Firing Line” to a debate on the proposition “Resolved: The ACLU is full of baloney.”

“So give the ACLU credit for rising above policy differences. When a combative climatologist, Penn State’s Michael Mann, filed a defamation lawsuit in 2012 against National Review, Mark Steyn, the Competitive Enterprise Institute and Rand Simberg, the conservative magazine found itself fighting alongside the left-leaning civil-liberties outfit.

“District of Columbia courts denied National Review’s motion to dismiss the case under the local anti-Slapp law, meant to thwart lawsuits aimed at silencing advocates on issues of public concern. The ACLU filed two friend-of-the-court briefs supporting the magazine’s appeals. One argued that the statements at issue are “constitutionally protected opinion and fair comment.” (News Corp, this newspaper’s owner, joined another brief on National Review’s behalf, filed by the Reporters Committee for Freedom of the Press.)

“Thus far, alas, the courts have found largely in Mr. Mann’s favor, most recently in March. If the ruling by the District of Columbia Court of Appeals is allowed to stand, parties will have an incentive to sue their adversaries and ask juries to settle what are essentially differences of opinion.”

An exception to this is the Canadian Courts which have found in favor of Tim Ball because Mr. Mann failed to produce the physical evidence supporting his claims.

The only hope now is that the Supreme Court—which considers National Review’s petition Oct. 1—will hear the case. The defendants say the statements in question were “a subjective opinion about a matter of scientific or political controversy,” protected by the First Amendment. Mr. Mann says they were false factual assertions. The D.C. judges say it’s up to a jury to distinguish fact from opinion.

Mr. Mann is famous in global-warming circles as the originator of the “hockey stick” graph. The graph charts the Earth’s temperatures since the year 1000, showing a slow, steady decline that turned sharply upward in the 20th century. Mr. Mann’s critics have questioned both his statistical methods and the proxies he used to estimate medieval surface temperatures.

“In an inflammatory 2012 CEI blog post, Mr. Simberg likened Mr. Mann to a notorious Penn State figure: “Mann could be said to be the Jerry Sandusky of climate science, except that instead of molesting children, he has molested and tortured data in the service of politicized science that could have dire economic consequences for the nation and planet.” Mr. Steyn quoted Mr. Simberg’s post on National Review’s website. Mr. Mann sued, saying he was being accused of “academic fraud.” He noted that academic and governmental investigations had cleared him of scientific wrongdoing.”

A previous Penn State investigation had cleared Mr Sandusky as well.

“The legal issue hinges on whether what Mr. Simberg said is subjective opinion that should be decided in public debate, as NR contends, or a factual assertion that a jury could find false and defamatory, as Mr. Mann claims. By sending the case to a jury, the D.C. Court of Appeals has rewarded Mr. Mann’s attempt to use the courts to settle the science and silence the criticism. That sets a dangerous precedent.

“In some senses the Mann suit may represent the perfect storm for litigation because so many consider climate science beyond question. The opinion of the appellate court, for example, carries

the whiff of a religious authority rendering final judgment—the idea being that university faculties and other authorities have spoken so debate must be closed.

“There’s also the venue. This lawsuit didn’t go through the federal courts but through D.C.’s equivalent of state courts, where judges and juries probably aren’t the friendliest to conservatives. With so many publications, think tanks and activists keeping offices in the nation’s capital, it isn’t hard to see how Washington could quickly become the venue for similar lawsuits.”

This distinction is important because the District of Columbia Court of Appeals is not the US Court of Appeals for the District of Columbia Circuit, which is frequently called the second most powerful court in the country, after the Supreme Court.

“The larger point is that while so-called climate deniers might be the first defendants, they are unlikely to be the last. If the D.C. ruling stands, National Review asks in its petition to the high court, what’s to prevent, say, Charles Koch from suing Greenpeace for accusing him of having funded a “junk study . . . loaded with lies and misrepresentations of actual climate change science”? Or Steve Bannon from founding a deep-pocketed organization to sue Trump opponents and then shopping for a venue where a friendly jury might agree that an over-the-top opinion is a defamatory statement of fact?

“‘The only way to protect free speech for our allies is to protect it for our adversaries,’ says Art Spitzer, legal director for the ACLU of D.C. ‘Today it’s unacceptable to deny climate change, but yesterday it was unacceptable to deny that homosexuality was sinful, and tomorrow it may be unacceptable to deny that robots are better parents than humans. Society can’t progress unless people are free to express and consider heretical ideas, because there’s no way to predict which heretical ideas will be tomorrow’s truths.’”

The views of people are not the same as physical evidence.

2. Endangered Green Auto Workers

The striking union figures out that electric cars will cost jobs.

Editorial, WSJ, Sep 23, 2019

<https://www.wsj.com/articles/endangered-green-auto-workers-11569280762>

TWTW Summary: The editorial states:

“Democratic presidential candidates have promised that they know how to create millions of green jobs to replace the ones they plan to kill in fossil-fuels production, but it seems that not even their friends at the United Auto Workers believe them. This is one reason that auto workers at GM are striking.

“Auto makers around the world are pumping billions of dollars into electric-car production to comply with government mandates. Some CEOs including GM’s Mary Barra believe electric cars will become more popular as batteries improve and decline in cost. But EVs make up only 2% of U.S. auto sales despite state and federal subsidies that can exceed \$10,000 per car.

“The economic risks are clear even to the UAW, which published a paper this spring warning that electric cars could cause thousands of job losses because they require fewer parts and less labor.

An electric powertrain for a Chevy Bolt has 80% fewer moving parts compared to an internal combustion engine, but it is about three times as expensive.

“Volkswagen CEO Herbert Diess has said that ‘building an electric car involves some 30% less effort than one powered by an [internal combustion engine]. That means we will need to make job cuts.’ GM will have to do likewise to compete. According to the paper, Ford has told investors ‘the product simplification that comes from EVs’ can lead to ‘a 30% reduction in labor hours per unit compared to ICE production.’”

The editorial continues with a discussion of how electric cars will crimp sales and profits, Further, it concludes with:

“Auto makers will also have to cut labor costs as electric cars crimp profits. The UAW says that China leads the world in lithium-ion battery production. Most lithium is extracted in Argentina, Zimbabwe, Chile, China and Australia while about 60% of cobalt is mined in the Democratic Republic of Congo (DRC) where kids earn \$1 to \$2 per day, according to the UAW. Environmentalists have opposed lithium mining in the U.S.

“One of the myths of the climate warriors is that remaking the global economy to purge fossil fuels is a free lunch. Someone will pay, as the auto workers have figured out.”
